

The background features a series of concentric circles in light gray, some solid and some dashed, creating a subtle pattern. A large, solid green speech bubble is centered on the page, pointing downwards. The text "Number System and Codes" is written in white inside the speech bubble.

# Number System and Codes

# Learning Outcome

- Define the following numbering systems
  - Decimal
  - Binary
  - Hexadecimal
- Capable of converting from one numbering or coding system to another
- Define Bit, Byte, Word, Least Significant Bit (LSB) and Most Significant Bit (MSB)
- Differentiate data types such as:
  - Boolean
  - Signed, unsigned Integer
  - Word, Double Word
  - Float, Real

# Numbering System Decimal

Basic knowledge of numbering system is necessary for programming PLC

Decimal: Base-10 numbering system or module 10 representation

Example:

$$3647 = 3 \times 10^3 + 6 \times 10^2 + 4 \times 10^1 + 7 \times 10^0 = 3000 + 600 + 40 + 7$$

# Numbering System Binary

Computers and digital systems including PLC uses binary system. Base-2 or module 2 representation.

- Each numeral has 2 states: 0 or 1.
- Binary could represent any value represented by Decimal or any other number systems by using more digits

Example:

$$1011_2 = 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 1 \times 2^0$$

$2^3$	$2^2$	$2^1$	$2^0$
1	0	1	1
MSB			LSB

Binary digit is also abbreviated to the term bit

- Most significant bit (MSB) has most weight
- Least significant bit (LSB) has least weight

# Numbering System Hexadecimal

Hexadecimal number system is commonly used in computer systems

- Base-16 or module 16 representation
- 0 to 9 and A to F for the 16 digits symbols
- It is divided into groups of 4 bits

You could easily convert the numeric systems using calculator.

# CODE - BCD

- What is coding?
- When number, letters or words are represented by a special group of symbols is encoding.

■ Code = group of symbols

## Binary-Coded-Decimal (BCD) Code

- Each decimal digit is up to 9
- 4 binary bits are required to code one decimal digit

8	7	4	Decimal
1000	0111	0100	BCD

Hexadecimal  
Decimal  
Binary  
BCD

Hexadecimal	Decimal	Binary	BCD
0	0	0000	0000
1	1	0001	0001
2	2	0010	0010
3	3	0011	0011
4	4	0100	0100
5	5	0101	0101
6	6	0110	0110
7	7	0111	0111
8	8	1000	1000
9	9	1001	1001
A	10	1010	0001 0000
B	11	1011	0001 0001
C	12	1100	0001 0010
D	13	1101	0001 0011
E	14	1110	0001 0100
F	15	1111	0001 0101

# Bits, Bytes & Words

- |                      |          |          |          |          |          |          |                  |                   |          |          |          |          |          |          |                      |
|----------------------|----------|----------|----------|----------|----------|----------|------------------|-------------------|----------|----------|----------|----------|----------|----------|----------------------|
| <b>M<br/>S<br/>B</b> |          |          |          |          |          |          | <b>Bit<br/>8</b> | <b>Bit<br/>7</b>  |          |          |          |          |          |          | <b>L<br/>S<br/>B</b> |
| <b>0</b>             | <b>1</b> | <b>1</b> | <b>0</b> | <b>0</b> | <b>1</b> | <b>1</b> | <b>0</b>         | <b>0</b>          | <b>1</b> | <b>1</b> | <b>0</b> | <b>0</b> | <b>1</b> | <b>1</b> | <b>1</b>             |
| <b>Upper Byte</b>    |          |          |          |          |          |          |                  | <b>Lower Byte</b> |          |          |          |          |          |          |                      |
| <b>16 – Bit Word</b> |          |          |          |          |          |          |                  |                   |          |          |          |          |          |          |                      |

<b>M S B</b>							Bit 8	Bit 7							<b>L S B</b>
0	1	1	0	0	1	1	0	0	1	1	0	0	1	1	1
Upper Byte								Lower Byte							
16 – Bit Word															

# Double Word

- The range of the numerical system depends on the number of bits
- 16-bit **Word (W)** would allow a maximum range of:
  - $2^{16} = 0 \text{ to } 2^{16} - 1$  (0 to 65535)
- In order to accommodate larger data, 2 words are grouped together to form a 32-bit **Double Word (DW)**
  - $2^{32} = 0 \text{ to } 2^{32} - 1$

# Data Types

- Data Type indicates the type of values or content the data could be assigned.
- ON/OFF digital signals are classified as Boolean data type (BOOL)
- Numerical and Binary data type has a great variety as below

Format	Data type	Number of bits	Value range	Initial value
Integer (w/sign) <sup>a</sup>	<i>SINT</i>	8	−128 to + 127	0
	<i>INT</i>	16	−32 768 to + 32 767	0
	<i>DINT</i>	32	−2 <sup>31</sup> to + 2 <sup>31</sup> -1	0
	<i>LINT</i>	64	−2 <sup>63</sup> to + 2 <sup>63</sup> -1	0
Positive integer (unsigned) <sup>b</sup>	<i>USINT</i>	8	0 to 255	0
	<i>UINT</i>	16	0 to 65 535	0
	<i>UDINT</i>	32	0 to 2 <sup>32</sup> -1	0
	<i>ULINT</i>	64	0 to 2 <sup>64</sup> -1	0
Floating-point numbers <sup>c</sup>	<i>REAL</i>	32	± 10 <sup>±38</sup>	0.0
	<i>LREAL</i>	64	± 10 <sup>±308</sup>	0.0

D, double; INT, integer; L, long; S, short; U, unsigned.

# Positive & Negative Numbers

- Example for Short Integer (SINT)
- Unsigned SINT would have the full 8 bits for magnitude
  - Unsigned Short Integer (USINT) = 0 to 256 ( $2^8 - 1$ )

## 8 bits constituting to Magnitude

1	0	1	0	1	0	1	0
---	---	---	---	---	---	---	---

- Did you notice that the signed data type range is half of the unsigned data type?
- Signed SINT, MSB is used as sign bit, hence only 7 bits available for magnitude
  - Signed Short Integer (SINT) = - 128 ( $2^7$ ) to 127 ( $2^7 - 1$ )

## Sign Bit 7 bits constituting to Magnitude

1	0	1	0	1	0	1	0
---	---	---	---	---	---	---	---

Format	Data type	Number of bits	Value range	Initial value
Integer (w/sign) <sup>a</sup>	<i>SINT</i>	8	-128 to + 127	0
	<i>INT</i>	16	-32 768 to + 32 767	0
	<i>DINT</i>	32	-2 <sup>31</sup> to + 2 <sup>31</sup> -1	0
	<i>LINT</i>	64	-2 <sup>63</sup> to + 2 <sup>63</sup> -1	0
Positive integer (unsigned) <sup>b</sup>	<i>USINT</i>	8	0 to 255	0
	<i>UINT</i>	16	0 to 65 535	0
	<i>UDINT</i>	32	0 to 2 <sup>32</sup> -1	0
	<i>ULINT</i>	64	0 to 2 <sup>64</sup> -1	0
Floating-point numbers <sup>c</sup>	<i>REAL</i>	32	± 10 <sup>±38</sup>	0.0
	<i>LREAL</i>	64	± 10 <sup>±308</sup>	0.0

D, double; INT, integer; L, long; S, short; U, unsigned.

# Floating Point REAL

- Floating Point is the representation of numbers with decimal point.
- This type of data require twice the register size to store the information that is split into 2 parts.
- Floating-point number = Mantissa · 10<sup>Exponent</sup>
- 12532 can be represented by 1.2532E+4
- 0.00001234 can be represented by 1.234E-5
- REAL is the data type for floating point number
- 32-bit REAL would have a range of -10<sup>38</sup> to 10<sup>38</sup>
- REAL data type is commonly used for intermediate storage and results of arithmetic

Format	Data type	Number of bits	Value range	Initial value
Integer (w/sign) <sup>a</sup>	<i>SINT</i>	8	-128 to + 127	0
	<i>INT</i>	16	-32 768 to + 32 767	0
	<i>DINT</i>	32	-2 <sup>31</sup> to + 2 <sup>31</sup> -1	0
	<i>LINT</i>	64	-2 <sup>63</sup> to + 2 <sup>63</sup> -1	0
Positive integer (unsigned) <sup>b</sup>	<i>USINT</i>	8	0 to 255	0
	<i>UINT</i>	16	0 to 65 535	0
	<i>UDINT</i>	32	0 to 2 <sup>32</sup> -1	0
	<i>ULINT</i>	64	0 to 2 <sup>64</sup> -1	0
Floating-point numbers <sup>c</sup>	<i>REAL</i>	32	± 10 <sup>±38</sup>	0.0
	<i>LREAL</i>	64	± 10 <sup>±308</sup>	0.0

D, double; INT, integer; L, long; S, short; U, unsigned.
